Lab Class 1 Assignment

Good examples of UI

As an example of good user interface I would like to focus on the Comboios de Portugal phone application. It provides a simple, organized and intuitive user experience. The design is minimalistic, there is a strictly followed colour scheme and it is intuitive to navigate in the app. Navigation system is also supported with identifiable icons and text labels that makes it easy to understand the different sections of the application. Different font sizes indicate user the action or function available in the according section of the app. The space is used wisely and has a clear layout, the app also has a good consistency, which facilitates for an easy learning and recognition.

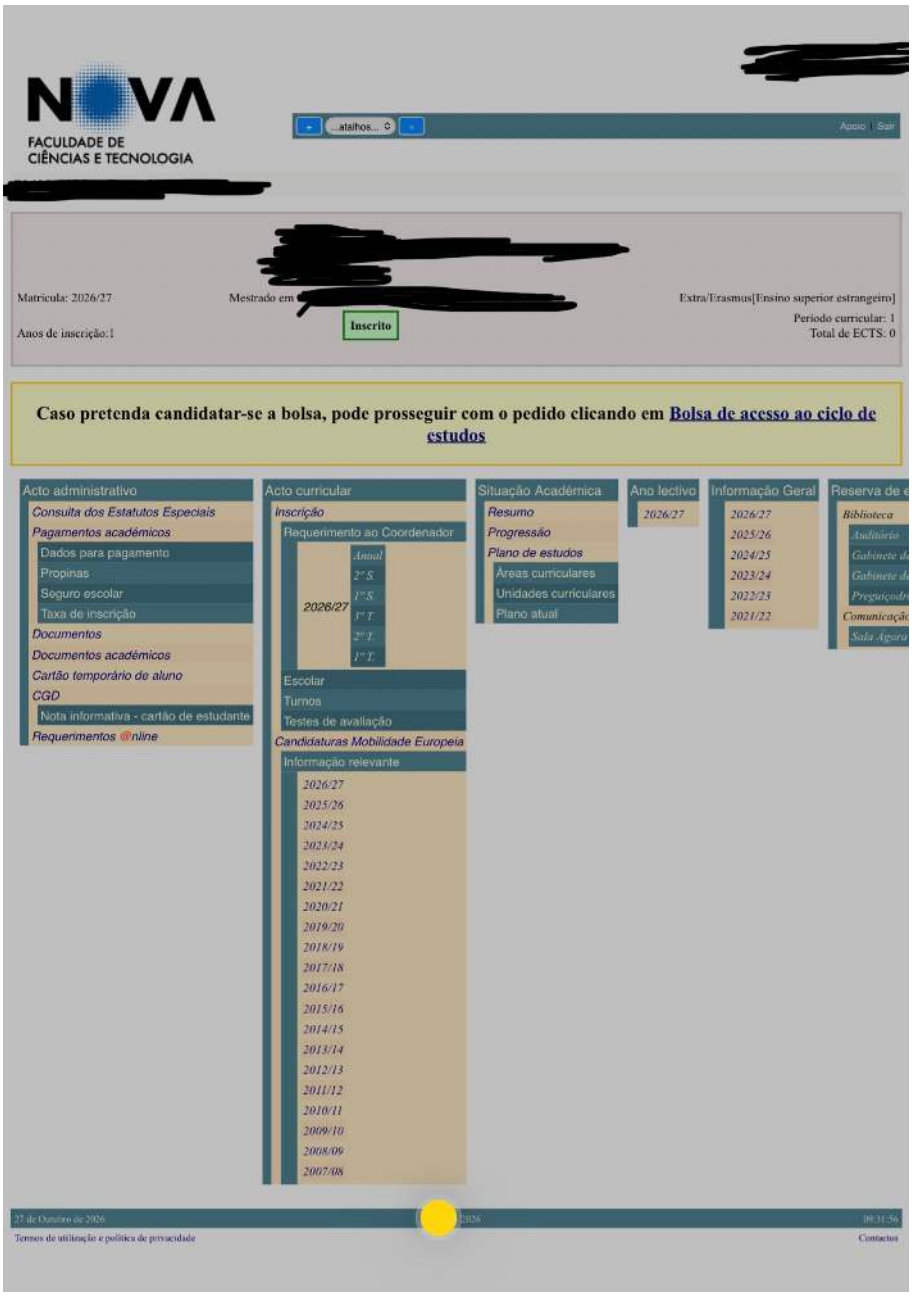

Another example of a good design would be Metro Ticket Machine in Lisbon. It has an old design, but it provides a strait forward and intuitive user experience. The screen is easy to navigate, the information is clearly presented and it's easy to change the language, making the machine accessible for locals and tourists. It is also directly clear that the machine is accepting bank cards, cash, coins and wireless cards. The machine also provides a effective visual feedback after purchasing the ticket. Once the ticket is purchased there would be a light indicating the transaction was successful and light blinking in the collection slot, guiding the person's attention to retrieve the ticket and the receipt.

Bad examples of UI

As a first bad example of UI, I have chosen website of Nova FCT. Visual presentation in the Clip makes it hard for students to navigate the website and to interact with it efficiently. The excessive number of menu options, poor visual hierarchy, small typography and inefficient use of screen space influence the user experience in a negative way. The interface seems to be designed around the organization of the administration of university rather than around the needs and expectations of students. Potentially with the time new features were added to the website and there was no clear organizational hierarchy on where to put those.
In order to make website better I would simplify the navigation, relating the services into more intuitive groups, would use more consistent colors and types and would prioritize student needs by creating an interface build around students needs.

As a second example of bad user interface I have chosen a vending machine in university buildings in Nova FCT. It is not intuitive that in order to pay with card a customer first needs to press 1 on the card reader machine to initiate the payment process and then select the number corresponding to the item they wish to buy on a separate interface. The connection between the two steps is not intuitive nor immediately obvious, so it can easily confuse. The instructions on the right side of the machine are written in a very small black font on white background, making them very difficult to read. Additionally, before completing the payment there is no visual feedback to understand if the product was chosen correctly. This lack of feedback can create uncertainty and make the customer question if all the actions have been done correctly. In order to make the vending machine better I would change the process - first selecting an item and second following the instructions on a card reader, potentially without pressing any button to pay with a card.
